# **Chapter 10**

# **STRAIGHT LINE**

**10.1 Overview**

**10.1.1** *Slope of a line*

If  $\theta$  is the angle made by a line with positive direction of *x*-axis in anticlockwise direction, then the value of tan  $\theta$  is called the **slope of the line** and is denoted by *m*.

The slope of a line passing through points  $P(x_1, y_1)$  and  $Q(x_2, y_2)$  is given by

$$
m = \tan \theta = \frac{y_2 - y_1}{x_2 - x_1}
$$

10.1.2 *Angle between two lines* The angle  $\theta$  between the two lines having slopes  $m_1$  and  $m_2$  is given by

$$
\tan\theta = \pm \frac{(m_1 - m_2)}{1 + m_1 m_2}
$$

If we take the acute angle between two lines, then tan  $\theta = \begin{bmatrix} m_1 & m_2 \\ 1 + m & m_1 \end{bmatrix}$  $1 + m_1 m_2$  $m_1 - m$  $\frac{m_1}{m_1}$ 

If the lines are parallel, then  $m_1 = m_2$ . If the lines are perpendicular, then  $m_1m_2 = -1$ .

**10.1.3** *Collinearity of three points* If three points P  $(h, k)$ , Q  $(x_1, y_1)$  and R  $(x_2, y_2)$ 

are such that slope of PQ = slope of QR, i.e.,  $\frac{y_1 - \kappa}{1} = \frac{y_2 - y_1}{1}$  $1 - n$   $x_2 - x_1$  $y_1 - k$   $y_2 - y$  $\frac{x_1}{x_1 - h} = \frac{y_2}{x_2 - x}$ 

or  $(h - x_1) (y_2 - y_1) = (k - y_1) (x_2 - x_1)$  then they are said to be collinear.

**10.1.4** *Various forms of the equation of a line*

- (i) If a line is at a distance *a* and parallel to *x*-axis, then the equation of the line is  $y = \pm a$ .
- (ii) If a line is parallel to *y*-axis at a distance *b* from *y*-axis then its equation is  $x = \pm b$

- (iii) Point-slope form : The equation of a line having slope *m* and passing through the point  $(x_0, y_0)$  is given by  $y - y_0 = m (x - x_0)$
- (iv) Two-point-form : The equation of a line passing through two points  $(x_1, y_1)$  and  $(x_2, y_2)$  is given by

$$
y - y_1 = \frac{y_2 - y_1}{x_2 - x_1} (x - x_1)
$$

(v) Slope intercept form : The equation of the line making an intercept *c* on *y*-axis and having slope *m* is given by

$$
y = mx + c
$$

Note that the value of *c* will be positive or negative as the intercept is made on the positive or negative side of the *y*-axis, respectively.

(vi) Intercept form : The equation of the line making intercepts *a* and *b* on *x*- and *y*-

axis respectively is given by  $\frac{x}{2} + \frac{y}{2} = 1$  $\frac{a}{a} + \frac{b}{b} = 1$ .

- (vii) Normal form : Suppose a non-vertical line is known to us with following data:
	- (a) Length of the perpendicular (normal) *p* from origin to the line.
	- (b) Angle  $\omega$  which normal makes with the positive direction of *x*-axis.
		- Then the equation of such a line is given by  $x \cos(\theta) + y \sin(\theta) = p$

**10.1.5** *General equation of a line*

Any equation of the form  $Ax + By + C = 0$ , where A and B are simultaneously not zero, is called the general equation of a line.

# **Different forms of**  $Ax + By + C = 0$

The general form of the line can be reduced to various forms as given below:

(i) Slope intercept form : If  $B \neq 0$ , then  $Ax + By + C = 0$  can be written as

$$
y = \frac{-A}{B}x + \frac{-C}{B}
$$
 or  $y = mx + c$ , where  $m = \frac{-A}{B}$  and  $c = \frac{-C}{B}$ 

If  $B = 0$ , then  $x =$ C which is a vertical line whose slope is not defined and *x*-intercept

$$
is \frac{-C}{A}
$$

.

 $\mathcal{L}_{\rm{c}}$ 

(ii) Intercept form: If C 
$$
\neq
$$
 0, then Ax + By + C = 0 can be written as  $\frac{x}{\frac{-C}{A}} + \frac{y}{\frac{-C}{B}}$ 

= 1 or 
$$
\frac{x}{a} + \frac{y}{b} = 1
$$
, where  $a = \frac{-C}{A}$  and  $b = \frac{-C}{B}$ 

If  $C = 0$ , then  $Ax + By + C = 0$  can be written as  $Ax + By = 0$  which is a line passing through the origin and therefore has zero intercepts on the axes.

.

 $\hat{A}$ 

(iii) Normal Form : The normal form of the equation  $Ax + By + C = 0$  is

 $x \cos \omega + y \sin \omega = p$  where,

$$
\cos \omega = \pm \frac{A}{\sqrt{A^2 + B^2}}, \sin \omega = \pm \frac{B}{\sqrt{A^2 + B^2}} \text{ and } p = \pm \frac{C}{\sqrt{A^2 + B^2}}.
$$

**Note:** Proper choice of signs is to be made so that *p* should be always positive.

**10.1.6** *Distance of a point from a line* The perpendicular distance (or simply distance) *d* of a point  $P(x_1, y_1)$  from the line  $Ax + By + C = 0$  is given by

$$
d = \frac{A x_1 + B y_1 + C}{\sqrt{A^2 + B^2}}
$$

# **Distance between two parallel lines**

The distance *d* between two parallel lines  $y = mx + c_1$  and  $y = mx + c_2$  is given by

$$
d = \frac{|c_1 - c_2|}{\sqrt{1 + m^2}}.
$$

**10.1.7** *Locus and Equation of Locus* The curve described by a point which moves under certain given condition is called its locus. To find the locus of a point P whose coordinates are (*h*, *k*), express the condition involving *h* and *k*. Eliminate variables if any and finally replace *h* by *x* and *k* by *y* to get the locus of P.

**10.1.8** *Intersection of two given lines* Two lines  $a_1x + b_1y + c_1 = 0$  and  $a_2x + b_2y + c_2 = 0$  $c_2$  = 0 are

(i) intersecting if 
$$
\frac{a_1}{a_2} \neq \frac{b_1}{b_2}
$$

(ii) parallel and distinct if 
$$
\frac{a_1}{a_2} = \frac{b_1}{b_2} \neq \frac{c_1}{c_2}
$$

 $\mathcal{L}$ 

(iii) coincident if 
$$
\frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}
$$

*Remarks*

- (i) The points  $(x_1, y_1)$  and  $(x_2, y_2)$  are on the same side of the line or on the opposite side of the line  $ax + by + c = 0$ , if  $ax_1 + by_1 + c$  and  $ax_2 + by_2 + c$  are of the same sign or of opposite signs respectively.
- (ii) The condition that the lines  $a_1x + b_1y + c_1 = 0$  and  $a_2x + b_2y + c = 0$  are perpendicular is  $a_1 a_2 + b_1 b_2 = 0$ .
- (iii) The equation of any line through the point of intersection of two lines  $a_1x + b_1y + c_2y + c_3y + c_4y + c_5y + c_6y$  $c_1 = 0$  and  $a_2x + b_2y + c_2 = 0$  is  $a_1x + b_1y + c_1 + k(ax_2 + by_2 + c_2) = 0$ . The value of *k* is determined from extra condition given in the problem.

# **10.2 Solved Examples**

# **Short Answer Type**

**Example 1** Find the equation of a line which passes through the point (2, 3) and makes an angle of 30° with the positive direction of *x*-axis.

Solution Here the slope of the line is  $m = \tan\theta = \tan 30^\circ =$ 1  $\overline{3}$  and the given point is

(2, 3). Therefore, using point slope formula of the equation of a line, we have

$$
y-3=\frac{1}{\sqrt{3}}(x-2)
$$
 or  $x-\sqrt{3y}+(3\sqrt{3}-2)=0.$ 

**Example 2** Find the equation of the line where length of the perpendicular segment from the origin to the line is 4 and the inclination of the perpendicular segment with the positive direction of *x*-axis is 30°.

**Solution** The normal form of the equation of the line is  $x \cos \omega + y \sin \omega = p$ . Here  $p = 4$  and  $\omega = 30^{\circ}$ . Therefore, the equation of the line is

*x*  $\cos 30^\circ + y \sin 30^\circ = 4$ 

$$
x\frac{\sqrt{3}}{2} + y\frac{1}{2} = 4
$$
 or  $\sqrt{3}x + y = 8$ 

**Example 3** Prove that every straight line has an equation of the form  $Ax + By + C = 0$ , where A, B and C are constants.

**Proof** Given a straight line, either it cuts the *y*-axis, or is parallel to or coincident with it. We know that the equation of a line which cuts the *y*-axis(i.e., it has *y*-intercept) can be put in the form  $y = mx + b$ ; further, if the line is parallel to or coincident with the *y*axis, its equation is of the form  $x = x_1$ , where  $x = 0$  in the case of coincidence. Both of these equations are of the form given in the problem and hence the proof.

**Example 4** Find the equation of the straight line passing through (1, 2) and perpendicular to the line  $x + y + 7 = 0$ .

**Solution** Let *m* be the slope of the line whose equation is to be found out which is perpendicular to the line  $x + y + 7 = 0$ . The slope of the given line  $y = (-1) x - 7$  is  $-1$ . Therefore, using the condition of perpendicularity of lines, we have  $m \times (-1) = -1$ or  $m = 1$  (Why?)

Hence, the required equation of the line is  $y - 1 = (1) (x - 2)$  or  $y - 1 = x - 2 \implies x - 1 = 1$  $y - 1 = 0$ .

**Example 5** Find the distance between the lines  $3x + 4y = 9$  and  $6x + 8y = 15$ . Solution The equations of lines  $3x + 4y = 9$  and  $6x + 8y = 15$  may be rewritten as

$$
3x + 4y - 9 = 0
$$
 and  $3x + 4y - \frac{15}{2} = 0$ 

Since, the slope of these lines are same and hence they are parallel to each other. Therefore, the distance between them is given by

$$
\left|\frac{9-\frac{15}{2}}{\sqrt{3^2+4^2}}\right| = \frac{3}{10}
$$

**Example 6** Show that the locus of the mid-point of the distance between the axes of the variable line *x*  $\cos \alpha + y \sin \alpha = p$  is  $\frac{1}{x^2} + \frac{1}{x^2} = \frac{4}{x^2}$  $x^2$   $y^2$  *p*  $+\frac{1}{2} = \frac{1}{2}$  where p is a constant.

**Solution** Changing the given equation of the line into intercept form, we have

$$
\frac{x}{\frac{p}{\cos \alpha}} + \frac{y}{\frac{p}{\sin \alpha}} = 1
$$
 which gives the coordinates  $\left(\frac{p}{\cos \alpha}, 0\right)$  and  $\left(0, \frac{p}{\sin \alpha}\right)$ , where the

line intersects *x*-axis and *y*-axis, respectively.

Let (*h*, *k*) denote the mid-point of the line segment joining the points

$$
\left(\frac{p}{\cos \alpha}, 0\right) \text{ and } \left(0, \frac{p}{\sin \alpha}\right)
$$
  
Then  $h = \frac{p}{2 \cos \alpha}$  and  $k = \frac{p}{2 \sin \alpha}$  (Why?)  
This gives  $\cos \alpha = \frac{p}{2h}$  and  $\sin \alpha = \frac{p}{2k}$ 

Squaring and adding we get

$$
\frac{p^2}{4h^2} + \frac{p^2}{4k^2} = 1 \quad \text{or} \quad \frac{1}{h^2} + \frac{1}{k^2} = \frac{4}{p^2}.
$$
  
Therefore, the required locus is 
$$
\frac{1}{x^2} + \frac{1}{y^2} = \frac{4}{p^2}.
$$

**Example 7** If the line joining two points A(2, 0) and B(3, 1) is rotated about A in anticlock wise direction through an angle of 15°. Find the equation of the line in new position.

Solution The slope of the line AB is  $\frac{1-0}{2}$  = 1 or tan 45  $\frac{3-2}{3-2}$  = 1 or tan 45°  $\frac{-2}{-2}$ =1 or tan 45° (Why?) (see Fig.). After

rotation of the line through 15°, the slope of the line AC in new position is tan 60° =  $\sqrt{3}$ 

**Fig. 10.1**

Therefore, the equation of the new line AC is

$$
y - 0 = \sqrt{3}(x - 2)
$$
 or  $y - \sqrt{3}x + 2\sqrt{3} = 0$ 

**Long Answer Type**

**Example 8** If the slope of a line passing through the point  $A(3, 2)$  is 3  $\frac{1}{4}$ , then find points on the line which are 5 units away from the point A.

Solution Equation of the line passing through  $(3, 2)$  having slope  $\frac{3}{4}$  $\frac{1}{4}$  is given by

$$
y-2 = \frac{3}{4} (x-3)
$$
  
3x + 1 = 0

or 
$$
4y - 3x + 1 = 0
$$
 (1)

Let  $(h, k)$  be the points on the line such that

$$
(h-3)^2 + (k-2)^2 = 25
$$
 (2) (Why?)

Also, we have

$$
4k - 3h + 1 = 0
$$
 (3) (Why?)

$$
k = \frac{3h-1}{4} \tag{4}
$$

Putting the value of  $k$  in (2) and on simplifying, we get

$$
25h2 - 150h - 175 = 0
$$
 (How?)  
or  

$$
h2 - 6h - 7 = 0
$$
  
(*h* + 1) (*h* - 7) = 0  $\Rightarrow$  *h* = -1, *h* = 7

Putting these values of  $k$  in (4), we get  $k = -1$  and  $k = 5$ . Therefore, the coordinates of the required points are either  $(-1, -1)$  or  $(7, 5)$ .

**Example 9** Find the equation to the straight line passing through the point of intersection of the lines  $5x-6y-1=0$  and  $3x+2y+5=0$  and perpendicular to the line  $3x-5y+$  $11 = 0.$ 

Solution First we find the point of intersection of lines  $5x - 6y - 1 = 0$  and  $3x + 2y + 1$ 5 = 0 which is (-1, -1). Also the slope of the line  $3x - 5y + 11 = 0$  is  $\frac{3}{5}$  $\frac{5}{5}$ . Therefore, the slope of the line perpendicular to this line is  $\frac{-5}{2}$  $\frac{1}{3}$  (Why?). Hence, the equation of the required line is given by

$$
y + 1 = \frac{-5}{3} (x + 1)
$$

$$
5x + 3y + 8 = 0
$$

**Alternatively** The equation of any line through the intersection of lines  $5x - 6y - 1 = 0$ and  $3x + 2y + 5 = 0$  is

$$
5x - 6y - 1 + k(3x + 2y + 5) = 0
$$
 (1)

or Slope of this line is 
$$
\frac{-(5+3k)}{-6+2k}
$$

Also, slope of the line  $3x - 5y + 11 = 0$  is  $\frac{3}{5}$ 5

Now, both are perpendicular

$$
so \frac{-(5+3k)}{-6+2k} \times \frac{3}{5} = -1
$$

$$
k = 45
$$

Therefore, equation of required line in given by

$$
5x - 6y - 1 + 45 (3x + 2y + 5) = 0
$$
  
or 
$$
5x + 3y + 8 = 0
$$

**Example 10** A ray of light coming from the point (1, 2) is reflected at a point A on the *x*-axis and then passes through the point (5, 3). Find the coordinates of the point A. **Solution** Let the incident ray strike *x*-axis at the point A whose coordinates be (*x*, 0). From the figure, the slope of the reflected ray is given by

**Fig. 10.2**

Again, the slope of the incident ray is given by

$$
\tan (\pi - \theta) = \frac{-2}{x - 1}
$$
 (Why?)  
or  

$$
-\tan \theta = \frac{-2}{x - 1}
$$
 (2)

Solving (1) and (2), we get

$$
\frac{3}{5-x} = \frac{2}{x-1} \quad \text{or} \ \ x = \frac{13}{5}
$$

Therefore, the required coordinates of the point A are  $\left(\frac{13}{5}, 0\right)$  $\left(\frac{15}{5}, 0\right)$ .

**Example 11** If one diagonal of a square is along the line  $8x - 15y = 0$  and one of its vertex is at (1, 2), then find the equation of sides of the square passing through this vertex.

**Solution** Let ABCD be the given square and the coordinates of the vertex D be (1, 2). We are required to find the equations of its sides DC and AD.

Given that BD is along the line  $8x - 15y = 0$ , so its slope is 8  $\frac{1}{15}$  (Why?). The angles made by BD with sides AD and DC is 45° (Why?). Let the slope of DC be *m*. Then

$$
\tan 45^\circ = \frac{m - \frac{8}{15}}{1 + \frac{8m}{15}}
$$
 (Why?)

$$
15 + 8m = 15m - 8
$$

or 
$$
7m = 23
$$
, which gives  $m = \frac{23}{7}$ 

Therefore, the equation of the side DC is given by

$$
y - 2 = \frac{23}{7} (x - 1) \text{ or } 23x - 7y - 9 = 0.
$$

Similarly, the equation of another side AD is given by

$$
y-2 = \frac{-7}{23}(x-1)
$$
 or  $7x+23y-53 = 0$ .

**Objective Type Questions**

Each of the Examples 12 to 20 has four possible options out of which only one option is correct. Choose the correct option (M.C.Q.).

**Example 12** The inclination of the line  $x - y + 3 = 0$  with the positive direction of *x*-axis is

(A)  $45^{\circ}$  (B)  $135^{\circ}$  (C)  $-45^{\circ}$  (D)  $-135^{\circ}$ 

Solution (A) is the correct answer. The equation of the line  $x - y + 3 = 0$  can be rewritten as  $y = x + 3 \implies m = \tan \theta = 1$  and hence  $\theta = 45^{\circ}$ .

**Example 13** The two lines  $ax + by = c$  and  $a'x + b'y = c'$  are perpendicular if

(A)  $aa' + bb' = 0$  (B)  $ab' = ba'$ (C)  $ab + a'b' = 0$  (D)  $ab' + ba' = 0$ 

Solution (A) is correct answer. Slope of the line  $ax + by = c$  is  $\frac{-a}{b}$  $\frac{a}{b}$ ,

and the slope of the line  $a'x + b'y = c'$  is  $\frac{-a}{a}$  $\frac{a}{b'}$  $\frac{1}{x}$ . The lines are perpendicular if

$$
\tan \theta = \frac{3}{5-x} \tag{1}
$$

$$
\left(\frac{-a}{b}\right)\left(\frac{-a'}{b'}\right) = -1 \quad \text{or} \quad aa' + bb' = 0 \tag{Why?}
$$

**Example 14** The equation of the line passing through (1, 2) and perpendicular to  $x + y + 7 = 0$  is

(A) 
$$
y-x+1=0
$$
 (B)  $y-x-1=0$ 

(C) 
$$
y - x + 2 = 0
$$
 (D)  $y - x - 2 = 0$ .

**Solution** (B) is the correct answer. Let the slope of the line be *m*. Then, its equation passing through  $(1, 2)$  is given by

$$
y - 2 = m(x - 1) \tag{1}
$$

Again, this line is perpendicular to the given line  $x + y + 7 = 0$  whose slope is – 1 (Why?) Therefore, we have  $m(-1) = -1$ or  $m = 1$ 

Hence, the required equation of the line is obtained by putting the value of *m* in (1), i.e.,

$$
y - 2 = x - 1
$$

or  $y - x - 1 = 0$ 

**Example 15** The distance of the point P  $(1, -3)$  from the line  $2y - 3x = 4$  is

(A) 13 (B) 
$$
\frac{7}{13}\sqrt{13}
$$
 (C)  $\sqrt{13}$  (D) None of these

Solution (A) is the correct answer. The distance of the point  $P(1, -3)$  from the line  $2y-3x-4=0$  is the length of perpendicular from the point to the line which is given by

$$
\left|\frac{2(-3)-3-4}{\sqrt{13}}\right| = \sqrt{13}
$$

**Example 16** The coordinates of the foot of the perpendicular from the point (2, 3) on the line  $x + y - 11 = 0$  are

(A)  $(-6, 5)$  (B)  $(5, 6)$  (C)  $(-5, 6)$  (D)  $(6, 5)$ 

Solution (B) is the correct choice. Let  $(h, k)$  be the coordinates of the foot of the perpendicular from the point (2, 3) on the line  $x + y - 11 = 0$ . Then, the slope of the

perpendicular line is – 3 2 *k*  $h-2$ . Again the slope of the given line  $x + y - 11 = 0$  is  $-1$ (why?)

Using the condition of perpendicularity of lines, we have

$$
\left(\frac{k-3}{h-2}\right)(-1) = -1
$$
 (Why?)

$$
k - h = 1 \tag{1}
$$

Since (*h*, *k*) lies on the given line, we have,

$$
h + k - 11 = 0 \text{ or } h + k = 11 \tag{2}
$$

Solving (1) and (2), we get  $h = 5$  and  $k = 6$ . Thus (5, 6) are the required coordinates of the foot of the perpendicular.

**Example 17** The intercept cut off by a line from *y*-axis is twice than that from *x*-axis, and the line passes through the point  $(1, 2)$ . The equation of the line is

(A) 
$$
2x + y = 4
$$
  
\n(B)  $2x + y + 4 = 0$   
\n(C)  $2x - y = 4$   
\n(D)  $2x - y + 4 = 0$ 

**Solution** (A) is the correct choice. Let the line make intercept '*a*' on *x*-axis. Then, it makes intercept '2*a*' on *y*-axis. Therefore, the equation of the line is given by

$$
\frac{x}{a} + \frac{y}{2a} = 1
$$

It passes through  $(1, 2)$ , so, we have

Here we

$$
\frac{1}{a} + \frac{2}{2a} = 1
$$
 or  $a = 2$ 

Therefore, the required equation of the line is given by

$$
\frac{x}{2} + \frac{y}{4} = 1 \quad \text{or} \quad 2x + y = 4
$$

**Example 18** A line passes through P (1, 2) such that its intercept between the axes is bisected at P. The equation of the line is

**Solution** The correct choice is (D). We know that the equation of a line making intercepts *a* and *b* with *x*-axis and *y*-axis, respectively, is given by

have 
$$
\frac{x}{a} + \frac{y}{b} = 1.
$$
  
have 
$$
1 = \frac{a+0}{2} \text{ and } 2 = \frac{0+b}{2},
$$
 (Why?)

which give  $a = 2$  and  $b = 4$ . Therefore, the required equation of the line is given by

$$
\frac{x}{2} + \frac{y}{4} = 1 \quad \text{or} \quad 2x + y - 4 = 0
$$

**Example 19** The reflection of the point  $(4, -13)$  about the line  $5x + y + 6 = 0$  is

(A) 
$$
(-1, -14)
$$
 (B)  $(3, 4)$  (C)  $(0, 0)$  (D)  $(1, 2)$ 

Solution The correct choice is  $(A)$ . Let  $(h, k)$  be the point of reflection of the given point  $(4, -13)$  about the line  $5x + y + 6 = 0$ . The mid-point of the line segment joining points  $(h, k)$ and  $(4, -13)$  is given by

$$
\left(\frac{h+4}{2}, \frac{k-13}{2}\right) \tag{Why?}
$$

This point lies on the given line, so we have

$$
5\left(\frac{h+4}{2}\right) + \frac{k-13}{2} + 6 = 0
$$

or  $5 h + k + 19 = 0$  (1)

*k* 13  $\frac{h}{h}$ Again the slope of the line joining points  $(h, k)$  and  $(4, -13)$  is given by  $\overline{-4}$ . This line 4  $\sim$  $\sim$ 

is perpendicular to the given line and hence 
$$
(-5)\left(\frac{k+3}{h-4}\right) = -1
$$
 (Why?)

This gives  $5k + 65 = h - 4$ 

 $\hat{\mathcal{A}}$ 

$$
h - 5k - 69 = 0 \tag{2}
$$

On solving (1) and (2), we get  $h = -1$  and  $k = -14$ . Thus the point  $(-1, -14)$  is the reflection of the given point.

**Example 20** A point moves such that its distance from the point (4, 0) is half that of its distance from the line  $x = 16$ . The locus of the point is

(A) 
$$
3x^2 + 4y^2 = 192
$$
  
\n(B)  $4x^2 + 3y^2 = 192$   
\n(C)  $x^2 + y^2 = 192$   
\n(D) None of these

Solution The correct choice is  $(A)$ . Let  $(h, k)$  be the coordinates of the moving point. Then, we have

$$
\sqrt{(h-4)^2 + k^2} = \frac{1}{2} \left( \frac{h-16}{\sqrt{1^2 + 0}} \right)
$$
 (Why?)

$$
\Rightarrow \qquad (h-4)^2 + k^2 = \frac{1}{4} (h-16)^2
$$
  
4  $(h^2 - 8h + 16 + k^2) = h^2 - 32h + 256$   
or  
 $3h^2 + 4k^2 = 192$ 

Hence, the required locus is given by  $3x^2 + 4y^2 = 192$ 

# **10.3 EXERCISE**

**Short Answer Type Questions**

- 1. Find the equation of the straight line which passes through the point  $(1, -2)$  and cuts off equal intercepts from axes.
- **2.** Find the equation of the line passing through the point (5, 2) and perpendicular to the line joining the points  $(2, 3)$  and  $(3, -1)$ .
- 3. Find the angle between the lines  $y = (2 \sqrt{3})(x + 5)$  and  $y = (2 + \sqrt{3})(x 7)$ .
- **4.** Find the equation of the lines which passes through the point (3, 4) and cuts off intercepts from the coordinate axes such that their sum is 14.
- 5. Find the points on the line  $x + y = 4$  which lie at a unit distance from the line  $4x + 3y = 10$ .

6. Show that the tangent of an angle between the lines 
$$
\frac{x}{a} + \frac{y}{b} = 1
$$
 and  $\frac{x}{a} - \frac{y}{b} = 1$  is

$$
\frac{2ab}{a^2-b^2}.
$$

- **7.** Find the equation of lines passing through (1, 2) and making angle 30° with *y*-axis.
- 8. Find the equation of the line passing through the point of intersection of  $2x + y =$ 5 and  $x + 3y + 8 = 0$  and parallel to the line  $3x + 4y = 7$ .
- **9.** For what values of *a* and *b* the intercepts cut off on the coordinate axes by the line  $ax + by + 8 = 0$  are equal in length but opposite in signs to those cut off by the line  $2x - 3y + 6 = 0$  on the axes.
- **10.** If the intercept of a line between the coordinate axes is divided by the point (–5, 4) in the ratio 1 : 2, then find the equation of the line.
- **11.** Find the equation of a straight line on which length of perpendicular from the origin is four units and the line makes an angle of 120° with the positive direction of *x*-axis.

[**Hint**: Use normal form, here  $\omega = 30^\circ$ .]

- **12.** Find the equation of one of the sides of an isosceles right angled triangle whose hypotenuse is given by  $3x + 4y = 4$  and the opposite vertex of the hypotenuse is (2, 2).
- **Long Answer Type**
- **13.** If the equation of the base of an equilateral triangle is  $x + y = 2$  and the vertex is  $(2, -1)$ , then find the length of the side of the triangle.

**[Hint:** Find length of perpendicular (p) from  $(2, -1)$  to the line and use  $p = l \sin$  $60^\circ$ , where *l* is the length of side of the triangle].

**14.** A variable line passes through a fixed point P. The algebraic sum of the perpendiculars drawn from the points  $(2, 0)$ ,  $(0, 2)$  and  $(1, 1)$  on the line is zero. Find the coordinates of the point P.

[**Hint:** Let the slope of the line be *m*. Then the equation of the line passing through the fixed point P  $(x_1, y_1)$  is  $y - y_1 = m(x - x_1)$ . Taking the algebraic sum of perpendicular distances equal to zero, we get  $y - 1 = m (x - 1)$ . Thus  $(x_1, y_1)$ is (1, 1).]

**15.** In what direction should a line be drawn through the point (1, 2) so that its point

of intersection with the line  $x + y = 4$  is at a distance  $\frac{\sqrt{6}}{2}$  $\frac{1}{3}$  from the given point.

**16.** A straight line moves so that the sum of the reciprocals of its intercepts made on axes is constant. Show that the line passes through a fixed point.

[**Hint:**  $\frac{x}{ } + \frac{y}{ } = 1$  $\frac{x}{a} + \frac{y}{b} = 1$  where  $\frac{1}{a} + \frac{1}{b}$  $\frac{1}{a} + \frac{1}{b} = \text{constant} = \frac{1}{k}$  $\frac{1}{k}$  (say). This implies that

 $k + \frac{k}{k} = 1$  $\frac{a}{a} + \frac{b}{b} = 1 \Rightarrow$  line passes through the fixed point (*k*, *k*).]

- **17.** Find the equation of the line which passes through the point (– 4, 3) and the portion of the line intercepted between the axes is divided internally in the ratio 5 : 3 by this point.
- **18.** Find the equations of the lines through the point of intersection of the lines

 $x - y + 1 = 0$  and  $2x - 3y + 5 = 0$  and whose distance from the point (3, 2) is  $\frac{7}{6}$  $\frac{1}{5}$ .

**19.** If the sum of the distances of a moving point in a plane from the axes is 1, then find the locus of the point. [**Hint**: Given that  $|x| + |y| = 1$ , which gives four sides of a square.]

20. P<sub>1</sub>, P<sub>2</sub> are points on either of the two lines  $y - \sqrt{3} |x| = 2$  at a distance of 5 units from their point of intersection. Find the coordinates of the foot of perpendiculars drawn from  $P_1$ ,  $P_2$  on the bisector of the angle between the given lines.

[**Hint**: Lines are  $y = \sqrt{3}x + 2$  and  $y = -\sqrt{3}x + 2$  according as  $x \ge 0$  or  $x < 0$ . *y*-axis is the bisector of the angles between the lines.  $P_1$ ,  $P_2$  are the points on these lines at a distance of 5 units from the point of intersection of these lines which have a point on *y*-axis as common foot of perpendiculars from these points. The *y*-coordinate of the foot of the perpendicular is given by 2 + 5 cos30°.]

21. If *p* is the length of perpendicular from the origin on the line  $\frac{x}{t} + \frac{y}{t} = 1$  $\frac{a}{a} + \frac{b}{b} = 1$  and  $a^2$ ,  $p^2$ ,  $b^2$  are in A.P, then show that  $a^4 + b^4 = 0$ .

# **Objective Type Questions**

Choose the correct answer from the given four options in Exercises 22 to 41

**22.** A line cutting off intercept – 3 from the *y*-axis and the tengent at angle to the *x*-

**23.** Slope of a line which cuts off intercepts of equal lengths on the axes is

(A) -1  
\n(B) -0  
\n(C) 2  
\n(D) 
$$
\sqrt{3}
$$

- **24.** The equation of the straight line passing through the point (3, 2) and perpendicular to the line  $y = x$  is
	- (A)  $x y = 5$  (B)  $x + y = 5$
	- (C)  $x + y = 1$  (D)  $x y = 1$
- **25.** The equation of the line passing through the point (1, 2) and perpendicular to the line  $x + y + 1 = 0$  is
	- (A)  $y-x+1=0$  (B)  $y-x-1=0$
	- (C)  $y-x+2=0$  (D)  $y-x-2=0$
- 26. The tangent of angle between the lines whose intercepts on the axes are  $a, -b$ and  $b, -a$ , respectively, is

(A) 
$$
\frac{a^2 - b^2}{ab}
$$
 (B)  $\frac{b^2 - a^2}{2}$  (C)  $\frac{b^2 - a^2}{2ab}$  (D) None of these

27. If the line  $\frac{x}{t} + \frac{y}{t} = 1$  $\frac{a^2 + b^2}{a^2 + b^2} = 1$  passes through the points (2, -3) and (4, -5), then (*a*, *b*) is

(A) 
$$
(1,1)
$$
 (B)  $(-1,1)$  (C)  $(1,-1)$  (D)  $(-1,-1)$ 

28. The distance of the point of intersection of the lines  $2x - 3y + 5 = 0$  and  $3x + 4y = 0$ from the line  $5x - 2y = 0$  is

(A) 
$$
\frac{130}{17\sqrt{29}}
$$
 (B)  $\frac{13}{7\sqrt{29}}$  (C)  $\frac{130}{7}$  (D) None of these

**29.** The equations of the lines which pass through the point (3, –2) and are inclined at 60° to the line  $\sqrt{3}$  *x* + *y* = 1 is

# (A)  $y + 2 = 0$ ,  $\sqrt{3}x - y - 2 - 3\sqrt{3} = 0$ (B)  $x-2=0$ ,  $\sqrt{3}$   $x-y+2+3\sqrt{3}=0$ (C)  $\sqrt{3} x - y - 2 - 3\sqrt{3} = 0$

(D) None of these

# 30. The equations of the lines passing through the point  $(1, 0)$  and at a distance  $\frac{\sqrt{3}}{2}$ 2 from the origin, are

- (A)  $\sqrt{3} x + y \sqrt{3} = 0, \sqrt{3} x y \sqrt{3} = 0$ (B)  $\sqrt{3}x + y + \sqrt{3} = 0, \sqrt{3}x - y + \sqrt{3} = 0$ (C)  $x + \sqrt{3} y - \sqrt{3} = 0, x - \sqrt{3} y - \sqrt{3} = 0$
- (D) None of these.
- **31.** The distance between the lines  $y = mx + c_1$  and  $y = mx + c_2$  is

(A) 
$$
\frac{c_1 - c_2}{\sqrt{m^2 + 1}}
$$
 (B)  $\frac{|c_1 - c_2|}{\sqrt{1 + m^2}}$  (C)  $\frac{c_2 - c_1}{\sqrt{1 + m^2}}$  (D) 0

**32.** The coordinates of the foot of perpendiculars from the point (2, 3) on the line  $y = 3x + 4$  is given by

(A) 
$$
\left(\frac{37}{10}, \frac{-1}{10}\right)
$$
 (B)  $\left(\frac{-1}{10}, \frac{37}{10}\right)$  (C)  $\left(\frac{10}{37}, -10\right)$  (D)  $\left(\frac{2}{3}, -\frac{1}{3}\right)$ 

**33.** If the coordinates of the middle point of the portion of a line intercepted between the coordinate axes is  $(3, 2)$ , then the equation of the line will be

(A) 
$$
2x + 3y = 12
$$
 (B)  $3x + 2y = 12$  (C)  $4x - 3y = 6$  (D)  $5x - 2y = 10$ 

34. Equation of the line passing through (1, 2) and parallel to the line  $y = 3x - 1$  is

(A) 
$$
y + 2 = x + 1
$$
 (B)  $y + 2 = 3(x + 1)$ 

- (C)  $y 2 = 3(x 1)$  (D)  $y 2 = x 1$
- 35. Equations of diagonals of the square formed by the lines  $x = 0$ ,  $y = 0$ ,  $x = 1$  and  $y = 1$  are
	- (A)  $y = x$ ,  $y + x = 1$  (B)  $y = x$ ,  $x + y = 2$ (C)  $2y = x$ ,  $y + x = \frac{1}{2}$ 3 (D)  $y = 2x$ ,  $y + 2x = 1$

**36.** For specifying a straight line, how many geometrical parameters should be known? (A) 1 (B) 2 (C) 4 (D) 3

- **37.** The point (4, 1) undergoes the following two successive transformations :
	- (i) Reflection about the line  $y = x$
	- (ii) Translation through a distance  $2$  units along the positive *x*-axis

Then the final coordinates of the point are

(A) (4,3) (B) (3,4) (C) (1,4) (D) 
$$
\left(\frac{7}{2}, \frac{7}{2}\right)
$$

38. A point equidistant from the lines  $4x + 3y + 10 = 0$ ,  $5x - 12y + 26 = 0$  and  $7x + 24y - 50 = 0$  is

(A)  $(1, -1)$  (B)  $(1, 1)$  (C)  $(0, 0)$  (D)  $(0, 1)$ 

39. A line passes through (2, 2) and is perpendicular to the line  $3x + y = 3$ . Its *y*intercept is

(A) 
$$
\frac{1}{3}
$$
 \t(B)  $\frac{2}{3}$  \t(C) 1 \t(D)  $\frac{4}{3}$ 

- 40. The ratio in which the line  $3x + 4y + 2 = 0$  divides the distance between the lines  $3x + 4y + 5 = 0$  and  $3x + 4y - 5 = 0$  is (A)  $1:2$  (B)  $3:7$  (C)  $2:3$  (D)  $2:5$
- **41.** One vertex of the equilateral triangle with centroid at the origin and one side as  $x + y - 2 = 0$  is

(A) 
$$
(-1, -1)
$$
 (B)  $(2, 2)$  (C)  $(-2, -2)$  (D)  $(2, -2)$ 

[**Hint**: Let ABC be the equilateral triangle with vertex  $A(h, k)$  and let  $D(\alpha, \beta)$ 

 $rac{2\alpha+h}{3}=0=\frac{2\beta+1}{3}$  $\alpha + h$   $\alpha$   $2\beta + k$ be the point on BC. Then  $= 0 = \frac{1}{2}$ . Also  $\alpha + \beta - 2 = 0$  and  $\mathbb{Z}^2$ 

$$
\left(\frac{k-0}{h-0}\right) \times (-1) = -1.
$$

Fill in the blank in Exercises 42 to 47.

- 42. If *a*, *b*, *c* are in A.P., then the straight lines  $ax + by + c = 0$  will always pass through \_\_\_\_.
- **43.** The line which cuts off equal intercept from the axes and pass through the point  $(1, -2)$  is  $\frac{1}{\sqrt{2}}$ .
- **44.** Equations of the lines through the point (3, 2) and making an angle of 45° with the line  $x - 2y = 3$  are \_\_\_\_\_.
- 45. The points  $(3, 4)$  and  $(2, -6)$  are situated on the <u>section</u> of the line  $3x 4y 8 = 0$ .
- **46.** A point moves so that square of its distance from the point (3, –2) is numerically equal to its distance from the line  $5x - 12y = 3$ . The equation of its locus is  $\overline{\phantom{a}}$
- 47. Locus of the mid-points of the portion of the line *x* sin  $\theta$  + *y* cos  $\theta$  = *p* intercepted between the axes is  $\_\_$ .

State whether the statements in Exercises 48 to 56 are true or false. Justify.

- **48.** If the vertices of a triangle have integral coordinates, then the triangle can not be equilateral.
- 49. The points  $A(-2, 1)$ ,  $B(0, 5)$ ,  $C(-1, 2)$  are collinear.
- 50. Equation of the line passing through the point  $(a \cos^3\theta, a \sin^3\theta)$  and perpendicular to the line *x* sec  $\theta$  + *y* cosec  $\theta$  = *a* is *x* cos  $\theta$  – *y* sin  $\theta$  = *a* sin 2 $\theta$ .
- **51.** The straight line  $5x + 4y = 0$  passes through the point of intersection of the straight lines  $x + 2y - 10 = 0$  and  $2x + y + 5 = 0$ .
- **52.** The vertex of an equilateral triangle is (2, 3) and the equation of the opposite side is

*x* + *y* = 2. Then the other two sides are *y* – 3 = (2  $\pm \sqrt{3}$ ) (*x* – 2).

- **53.** The equation of the line joining the point (3, 5) to the point of intersection of the lines  $4x + y - 1 = 0$  and  $7x - 3y - 35 = 0$  is equidistant from the points (0, 0) and (8, 34).
- 54. The line  $\frac{x}{1} + \frac{y}{1} = 1$  $a + \frac{b}{b} = 1$  moves in such a way that  $a^2 + \frac{c}{b^2} = \frac{c^2}{c^2}$  $1 \t1 \t1$  $\overline{a^2} + \overline{b^2} = \overline{c^2}$ , where *c* is a constant.

The locus of the foot of the perpendicular from the origin on the given line is  $x^2 + y^2 = c^2$ .

- 55. The lines  $ax + 2y + 1 = 0$ ,  $bx + 3y + 1 = 0$  and  $cx + 4y + 1 = 0$  are concurrent if *a*, *b*, *c* are in G.P.
- 56. Line joining the points  $(3, -4)$  and  $(-2, 6)$  is perpendicular to the line joining the points  $(-3, 6)$  and  $(9, -18)$ .

Match the questions given under Column  $C_1$  with their appropriate answers given under the Column  $C_2$  in Exercises 57 to 59.
